

ABSTRACT OF THE DISCLOSURE

A connector having a male-side connection section, a liquid flow section where a liquid flow space communicating with the inside of the male-side connection section is provided, a first female-side connection opening and a second female-side connection opening, and a first valve body and a second valve body that are made from an elastic material. A side slit of the first valve body and a side slit of the second valve body face the liquid flow space. When a tube body is connected to the first female-side connection opening, the inside of the tube body and the inside of the male-side connection section are communicated through a top slit, the side slit, and the liquid flow space.. When a tube body is connected to the second female-side connection opening, the inside of the tube body and the inside of the male-side connection section are communicated through a top slit, the side slit, and the liquid flow space.
